

# Social Interactions in the Demand for Private Health Insurance: Evidence from Linked Employer-Employee Data

Ali Furkan Kalay<sup>12</sup>    Alicia N. Rambaldi<sup>2</sup>    Christiern Rose<sup>2</sup>

<sup>1</sup>Macquarie University Centre for Health Economy

<sup>2</sup>The University of Queensland

19 March 2024

Workshop on Economics of Health and Wellbeing  
Macquarie University

# Motivation

1. Does peers' health shocks affect the PHI demand?
2. If so, why?

# Introduction

- ▶ This study investigates the effects of **coworkers' health shocks** on the private health insurance (**PHI**) demand using Australian linked employee-employer data.
- ▶ Coworkers as “**free consultants**” in many decisions.
- ▶ Peer effects in transitional probabilities:

# Data

- ▶ The newly available linked administrative data are of high quality, similar to those used in Scandinavian countries.
- ▶ Population-based administrative records.
  - ▶ Individual tax records + health records + *other*
- ▶ Advantages:
  - ▶ Australia is larger and culturally distinct from countries in which such data are typically available.
  - ▶ Small firms!
    - ▶ [De Giorgi et al. \(2020\)](#) investigates peer effects in consumption using Danish data, where the average firm size is 260-330.

# Measuring Health Shocks

- ▶ Australia has a universal healthcare system called Medicare.

# Measuring Health Shocks

- ▶ Australia has a universal healthcare system called Medicare.
- ▶ **Pharmaceutical Benefits Scheme (PBS):** The PBS is a government-funded program that provides subsidized prescription medicines to Medicare cardholders.

# Measuring Health Shocks

- ▶ Australia has a universal healthcare system called Medicare.
- ▶ **Pharmaceutical Benefits Scheme (PBS):** The PBS is a government-funded program that provides subsidized prescription medicines to Medicare cardholders.
- ▶ **Filter:** Patients need a prescription from a physician to utilize the PBS benefits.
  - ▶ “Expenditure and prescriptions twelve months to 30 June 2016”  
([Thomas & Marlon, 2016](#))

# Measuring Health Shocks

- ▶ Australia has a universal healthcare system called Medicare.
- ▶ **Pharmaceutical Benefits Scheme (PBS):** The PBS is a government-funded program that provides subsidized prescription medicines to Medicare cardholders.
- ▶ **Filter:** Patients need a prescription from a physician to utilize the PBS benefits.
  - ▶ “Expenditure and prescriptions twelve months to 30 June 2016”  
([Thomas & Marlon, 2016](#))
- ▶ **Variable:** *The total number of PBS Transactions in the financial year 2015-2016 (PTC)*

# Descriptive Plots: Age & Gender

Figure: PTC by Age, Gender and PHI Ownership

Figure: PHI Ownership by Age and Gender

# Econometric Specification

- ▶ Linear probability model (Boucher & Bramoullé, 2020).
- ▶ Transition probabilities are conditioned on  $y_{i,t} = Y \in \{0, 1\}$

$$\mathbb{P} \left[ y_{i,t+1} = 1 | y_{i,t} = Y, a_{j,Y}, h_{i,t}, \bar{h}_{-i,t}, \mathbf{z}_{i,t}, \mathbf{x}_{i,t+1} \right] \quad (1)$$

where

- ▶  $a_{j,Y}$ : The firm  $j$  fixed effects conditional on  $Y$  at time  $t$ .

# Econometric Specification

- ▶ Linear probability model (Boucher & Bramoullé, 2020).
- ▶ Transition probabilities are conditioned on  $y_{i,t} = Y \in \{0, 1\}$

$$\mathbb{P} \left[ y_{i,t+1} = 1 | y_{i,t} = Y, a_{j,Y}, h_{i,t}, \bar{h}_{-i,t}, \mathbf{z}_{i,t}, \mathbf{x}_{i,t+1} \right] \quad (1)$$

where

- ▶  $a_{j,Y}$ : The firm  $j$  fixed effects conditional on  $Y$  at time  $t$ .
- ▶  $h_i$ : The health shock variable at time  $t$ .

# Econometric Specification

- ▶ Linear probability model (Boucher & Bramoullé, 2020).
- ▶ Transition probabilities are conditioned on  $y_{i,t} = Y \in \{0, 1\}$

$$\mathbb{P} \left[ y_{i,t+1} = 1 | y_{i,t} = Y, a_{j,Y}, h_{i,t}, \bar{h}_{-i,t}, \mathbf{z}_{i,t}, \mathbf{x}_{i,t+1} \right] \quad (1)$$

where

- ▶  $a_{j,Y}$ : The firm  $j$  fixed effects conditional on  $Y$  at time  $t$ .
- ▶  $h_i$ : The health shock variable at time  $t$ .
- ▶  $\bar{h}_{-i}$ : Co-workers' average  $h$ , excluding  $i$  at time  $t$ .
  - ▶ **Main interest!!**

## Identification (1): Measuring Health Shocks

$$h_{i,t} = \ln(PTC_{i,t}) - \mathbb{E}[\ln(PTC_{i,t}) | PHI_{i,t} = y, j, \mathbf{z}_{i,t}] \quad (2)$$

- ▶ **Health shock:** Deviations from the gender-age norms ( $\mathbf{z}_{i,t}$ ).
- ▶ We assume Equation 2 linear in  $\mathbf{z}_{i,t}$ .
  - ▶ In practice, it is a non-linearized linear model.
- ▶ Plugging linearized Equation (2) to the main model, we show that own health shocks and co-worker's health shocks are identified from PTC coefficients ( $p_{i,t} = \ln(PTC_{i,t})$ ),

$$\begin{aligned} & \mathbb{P}[y_{i,t+1} = 1 | y_{i,t} = Y, \dots] \\ &= c_{j,y} + \alpha_y p_{i,t} + \beta_y \bar{p}_{-i,t} + \mathbf{z}'_{i,t} \theta_y + \bar{\mathbf{z}}'_{-i,t} \lambda_y + \mathbf{x}'_{i,t+1} \delta_y. \end{aligned}$$

## Identification (2): Endogenous Peer Effects

$$\begin{aligned} & \mathbb{P}[y_{i,t+1} = 1 | y_{i,t} = Y, \dots] \\ &= \textcolor{red}{c}_{j,y} + \alpha_y p_{i,t} + \beta_y \bar{p}_{-i,t} + \mathbf{z}'_{i,t} \theta_y + \bar{\mathbf{z}}'_{-i,t} \lambda_y + \mathbf{x}'_{i,t+1} \delta_y. \end{aligned} \quad (3)$$

- ▶ **Firm fixed effects** ( $\textcolor{red}{c}_{j,y}$ ): Allowed to vary with the transitional direction, i.e.,  $y_{i,t}$ .
  1. Sample Sorting: Firm-level correlated effects.
  2. Endogenous Peer Effects: Co-workers average PHI ownership excluding  $i$  in the firm.
    - ▶ Main identification challenge in peer effects estimations ([Manski, 1993](#); [Bramoullé et al., 2009](#)).
    - ▶ We exploit the fact that the outcome variable is binary and  $\bar{y}_{-i}$  can only take two values within the firm conditional on  $y_{i,t-1} \in \{0, 1\}$ . Example
- ▶ **Source of Identification:** Variation in firm sizes.

## Results

## Results: Summary

- ▶ Co-workers' health shocks increase PHI demand only for females *if they did not own PHI in the past.*
  - ▶ Alternative Measures
- ▶ We find that effects are stronger for singles and older females.
  - ▶ By Family Structure   By Age
- ▶ Exclusion of large firms increases efficiency and the magnitude of coefficient.
  - ▶ Firm Size Restrictions
- ▶ Extreme health shocks have stronger effects.

# Conclusion

- ▶ We estimate contextual peer effects ([Manski, 1993](#)) without instrumental variables by exploiting the availability of consumers' decisions in two consecutive periods.
- ▶ We find significant heterogeneity, which is often difficult to disentangle due to data limitations.
- ▶ **Implies Flexible Utility Function** – unlike the conventional linear-in-mean specifications.
  - ▶ Microfoundations

# Thank You!

## Additional Slides

- ▶ Microfoundation
- ▶ Literature
- ▶ Graphs
- ▶ Why People Purchase PHI?
- ▶ Other Estimations

# Microfoundations

- ▶ The linear-in-means model implies a quadratic utility function that is very restrictive.
- ▶ [Boucher et al. \(2024\)](#) proposes a new approach that implies a more flexible microfoundation for peer effects models. (CES Utility function)
- ▶ Our empirical strategy does not impose any restriction of the consumers' utility function (regarding the endogenous peer effects),

$$y = f(\bar{y}) + \beta X + \epsilon.$$

Conclusion

# Literature

- ▶ Peer effects in health insurance:
  - ▶ [Lieber & Skimmyhorn \(2018\)](#) investigate the peer effects in financial decisions such as retirement savings, life insurance, and charitable giving.
    - ▶ Peers affect charitable giving decision, but do not affect retirement savings or insurance purchase.
    - ▶ Observability of the decision could be critical.
  - ▶ [Handel et al. \(2020\)](#) investigate the determinants of choice quality in the Netherlands.
    - ▶ People tend to choose similar plans as their peers.
- ▶ Our econometric results also relate to the discussions on heterogeneity in peer effects estimations ([Lin et al., 2021](#)).

# A Simple Example for Identification

**A simple example:** Consider a firm,  $j$  with four employees. Assume  $PHI_{1,t} = PHI_{2,t} = 1$  and  $PHI_{3,t} = PHI_{4,t} = 0$ . The average  $PHI$  ownership excluding the focal individual is computed as  $\overline{PHI}_{-i,t} = 1/3$ ,  $i = 1, 2$  and  $\overline{PHI}_{-i,t} = 2/3$ ,  $i = 3, 4$ . These terms are captured by  $c_{j,1}$  and  $c_{j,0}$ , respectively.

Appendix

Identification (2)

# Why do People Purchase PHI in Australia?

## 1. Financial Reasons

- ▶ Reduced tax liabilities
- ▶ Lifetime health cover

## 2. Health Reasons

- ▶ Access to private hospitals
- ▶ Choice of doctor and flexibility in selecting treatment options
- ▶ Coverage for extras such as dental and physiotherapy
- ▶ Shorter waiting times for elective surgeries
